## The Floating Knife

**Morakniv is announcing the new Floating Knife. A perfect tool for your adventure, whether it's for the fishing trip, when you work near water or when you're lightweight hiking. The Floating Knife is a Morakniv for professionals as well as for adventurers.**

The knife that floats thanks to the natural cork handle weighs only 49 grams and has a 1.4 mm blade made of stainless steel. The blade is designed to be used as an all-round knife for every occasion. The Floating Knife has a core and a sheath made of lime polymer making it highly visible and easy to locate.

“The knife is designed to be used near water because it floats if you accidentally drop it. It weights very little which makes it an excellent knife to take with you on the mountain hike, where every gram plays a role. Using materials such as cork allows us to create lighter designs and in this case allow a knife to float. In this way, we can cater to new customer groups and users in mora segments around the world.” Says Karolina Eriksson, Product developer at Morakniv.

### About Floating Knife

The Floating Knife is a very lightweight knife, easy to take with you by connecting it to your belt, backpack or lifesaving vest with the clip on the sheath. It's also possible to attach it to a button, for example on your working clothes. A high visible lime sheath with a smart button lets you connect and link several knives from our Craft segment, giving you the opportunity to carry your preferred combination of models. The handle in cork is very pleasant to hold and it does not conduct cold, a pleasure if you're using it in icy water.
